

Reflection on My Portfolio Project

Working on my personal portfolio website has been a rewarding learning experience. I've gained practical skills in React, Bootstrap, and responsive design while building something that represents me professionally. Through this project, I've learned how to structure components in a React app, manage styling with both Bootstrap and custom CSS, and connect everything smoothly to GitHub and Netlify for version control and deployment.

Challenges I Faced:

One of the main challenges was troubleshooting errors when setting up the project structure - especially getting the components and file paths right. I also ran into some issues with live reloading and deployment, which took time to debug and understand. Learning how to use Git and push my project to GitHub for the first time was another hurdle, but I'm proud that I figured it out with some patience and guidance.

What I'll Improve With More Time:

If I had more time, I'd focus on improving the design and UI/UX further - maybe adding animations or dark mode, and refining the responsiveness across all screen sizes. I'd also like to enhance the functionality by including a contact form with backend handling and improving accessibility for all users.
